

Business Requirement: AI-Powered Job Application System

Objective:

Develop a web-based platform that automates and optimizes the job application process for candidates, ensuring improved job matching accuracy and streamlined resume submissions.

Key Functional Requirements

1. AI-Powered Job Matching:

- Implement intelligent matching algorithms that analyze user profiles, resumes, and job descriptions to recommend the most relevant job opportunities.
- Display match scores (e.g., ATS score) to help users prioritize applications.

2. Job Search & Filter:

- Provide users with an advanced search interface with filters such as job title, keywords, location, company, job type, job level, and salary range.
- Display a dynamic count of matching jobs based on selected filters.

3. Automated Resume Tailoring:

- Allow users to upload resumes (PDF, DOCX, TXT) and generate tailored versions optimized for each job description.
- Include keyword recommendations and formatting suggestions to maximize ATS (Applicant Tracking System) compatibility.

4. One-Click Application Submission:

- Enable users to review and apply to matched jobs directly through the platform with a single click.
- Include automated application form filling where applicable.

5. User Dashboard:

- Provide a dashboard to track submitted applications, saved jobs, and ATS scores.
- Offer real-time notifications for application updates and new matching job postings.

6. Integration with Partner Companies:

- Connect the platform with multiple job boards and company portals for real-time job postings and application submissions.

7. Analytics & Reporting:

- Generate metrics such as application success rates, number of jobs applied, and resume optimization scores for each user.

Non-Functional Requirements

- The system must be mobile-responsive and support major browsers.
- Ensure secure storage of user data with encrypted transmission and storage.
- Support at least 50,000 active job listings and scale to handle 500,000 concurrent users.
